# 1 Weakest liberal precondition calculus definitions over selfframed non-gradual formulas

$$\begin{aligned} & \text{WLP}(skip, \widehat{\phi}) = \widehat{\phi} \\ & \text{WLP}(s_1; s_2, \widehat{\phi}) = \text{WLP}(s_1, \text{WLP}(s_2, \widehat{\phi})) \\ & \text{WLP}(T \ x := e, \widehat{\phi}) = \max_{\Rightarrow} \left\{ \widehat{\phi}' \mid \widehat{\phi}' \Rightarrow \widehat{\phi}[e/x] \quad \land \quad \widehat{\phi}' \Rightarrow \text{acc}(e) \right\} \\ & \text{WLP}(if \ (x \odot y) \ \{s_1\} \ else \ \{s_2\}, \widehat{\phi}) = \\ & \text{WLP}(x.f := y, \widehat{\phi}) = \text{acc}(x.f) * \max_{\Rightarrow} \left\{ \widehat{\phi}' \mid \widehat{\phi}' * \text{acc}(x.f) * (x.f = y) \Rightarrow \widehat{\phi} \ \land \ \widehat{\phi}' * \text{acc}(x.f) \in \text{SATFORMULA} \right\} \\ & \text{WLP}(x := new \ C, \widehat{\phi}) = \max_{\Rightarrow} \left\{ \widehat{\phi}' \mid \widehat{\phi}' * (x \neq null) * \overline{\text{acc}(x.f_i)} \Rightarrow \widehat{\phi} \right\} \\ & \text{where fields}(C) = \overline{T_i \ f_i} \\ & \text{WLP}(y := z.m(\overline{x}), \widehat{\phi}) = \text{undefined} \\ & \text{WLP}(y := z.m_C(\overline{x}), \widehat{\phi}) = \max_{\Rightarrow} \left\{ \widehat{\phi}' \mid y \not \in \text{FV}(\widehat{\phi}') \quad \land \quad \widehat{\phi}' \Rightarrow (z \neq null) * \text{pre}(C, m) \left[ z/this, \overline{x_i/\text{params}(C, m)_i} \right] \\ & \land \quad \widehat{\phi}' * \text{post}(C, m) \left[ z/this, \overline{x_i/\text{old}(\text{params}(C, m)_i)}, y/result \right] \Rightarrow \widehat{\phi} \right\} \\ & \text{WLP}(assert \ \phi_a, \widehat{\phi}) = \max_{\Rightarrow} \left\{ \widehat{\phi}' \mid \widehat{\phi}' \Rightarrow \widehat{\phi} \quad \land \quad \widehat{\phi}' \Rightarrow \phi_a \right\} \end{aligned}$$

$$WLP(assert \ \phi_a, \phi) = \max_{\Rightarrow} \left\{ \phi' \mid \phi' \Rightarrow \phi \quad \land \right.$$

$$WLP(release \ \phi_a, \widehat{\phi}) =$$

WLP(hold 
$$\phi_a \{s\}, \widehat{\phi}) =$$

#### Note:

**Dynamic method calls.** Dynamic method calls are left undefined, because we are not verifying programs with dynamic dispatch at this time (all method calls should be static method calls). They are included in the grammar for future implementation.

If & Release & hold. Definitions coming soon.

Predicates in the logic. Although the grammar allows for abstract predicate families, we do not support them yet. Therefore, we assume formulas look like:

$$\phi ::= \text{true} \mid e \odot e \mid acc(e.f) \mid \phi * \phi$$

# Algorithmic WLP calculus definitions over self-framed non- $\mathbf{2}$ gradual formulas

#### Note:

It may be helpful to check that the WLP $(s, \widehat{\phi})$  is well-formed and/or self-framed for some of the more complicated rules, which may be buggy in implementation.

#### Note:

We do not always calculate the correct WLP due to a limitation in the expressiveness of our specification language. Concrete formulas which do not contain enough information to determine whether two or more objects alias, wrongly assume that those two or more objects do not alias. This is because our current specification language is missing a logical OR or a conditional construct, which would allow us to write self-framed concrete formulas that capture the unknown aliasing between two or more objects. A conditional construct will be added and the definitions below adjusted in the near future.

$$WLP(skip, \widehat{\phi}) = \widehat{\phi}$$

$$WLP(s_1; s_2, \widehat{\phi}) = WLP(s_1, WLP(s_2, \widehat{\phi}))$$

$$\begin{split} \text{WLP}(T\ x := e, \widehat{\phi}) &= \begin{cases} \widehat{\phi}[e/x] & \text{if } \widehat{\phi}[e/x] \Rightarrow acc(e) \\ acc(e) * \widehat{\phi}[e/x] & \text{otherwise} \end{cases} \\ \text{Check that WLP}(T\ x := e, \widehat{\phi}) * x = e \Rightarrow \widehat{\phi} \text{ and that WLP}(T\ x := e, \widehat{\phi}) \text{ is satisfiable.} \end{split}$$

$$WLP(if (x \odot y) \{s_1\} else \{s_2\}, \widehat{\phi}) =$$

$$\begin{split} \text{WLP}(x.f := y, \widehat{\phi}) &= \begin{cases} \widehat{\phi}[y/x.f] & \text{if } \widehat{\phi}[y/x.f] \Rightarrow acc(x.f) \\ acc(x.f) * \widehat{\phi}[y/x.f] & \text{otherwise} \end{cases} \\ \text{Check that WLP}(x.f := y, \widehat{\phi}) * x.f &= y \Rightarrow \widehat{\phi} \text{ and that WLP}(x.f := y, \widehat{\phi}) \text{ is satisfiable.} \end{split}$$

Important cases to consider:

$$\widehat{\phi} = acc(x.f) * x.f = p * x.f = q * a = b$$

$$\widehat{\phi} = acc(x.f) * acc(x.f.f) * x = y$$

$$\text{WLP}(x := new\ C, \widehat{\phi}) = \begin{cases} \widehat{\phi} \div x & \text{if } (\widehat{\phi} \div x) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \Rightarrow \widehat{\phi} \\ undefined & otherwise \end{cases}$$

where fields $(C) = \overline{T_i f_i}$ ,  $\widehat{\phi} \div x$  means to transitively expand (in-)equalities  $(\odot)$  and then remove conjunctive terms containing x, and  $x \neq e_i$  are conjunctive terms in  $\widehat{\phi}$ .

Check WLP $(x := new \ C, \hat{\phi})$  is satisfiable.

#### Important cases to consider:

- $\widehat{\phi} = x \neq null * acc(x.f)$
- $\widehat{\phi} = x \neq null * acc(x.f) * x.f = 1 * x.f = y$  should fail, bad postcondition
- $\widehat{\phi} = x \neq null * acc(x.f) * x = y * x = z$  should fail, bad post condition
- $\widehat{\phi} = x \neq null * acc(x.f) * x = y * y = z$  should fail, bad postcondition
- $\widehat{\phi} = x \neq null * acc(x.f) * x \neq y * y = z$
- $\widehat{\phi} = x \neq null * acc(x.f) * acc(x.f.f) * x.f.f \neq y$  should fail, bad postcondition
- $\widehat{\phi} = x \neq null * acc(y.f) * x = y$  should fail, bad postcondition
- $\widehat{\phi} = x \neq null * acc(x.f) * y > x.f * x.f > z * r \geq x.f * x.f \geq s \text{ should fail, bad postcondition}$

#### Note:

 $x := new\ C$  creates a fresh object and assigns it to x without setting default values to the object's fields; therefore, postconditions cannot say anything about the value of x other than it does not equal other values (no aliasing with x) and they cannot say anything about the values of the fields of x.

$$WLP(y := z.m(\overline{x}), \widehat{\phi}) = undefined$$

$$WLP(y := z.m_C(\overline{x}), \widehat{\phi}) = IN PROGRESS$$

$$WLP(assert \ \phi_a, \widehat{\phi}) = \widehat{\phi}_{acc} * | \phi_a | * | \widehat{\phi} |$$

where  $|\phi|$  means the formula  $\phi$  without accessibility predicates and  $\widehat{\phi}_{acc}$  is the self-framed formula which contains the accessibility predicates that frame  $|\phi_a|*|\widehat{\phi}|$  and, in general, the accessibility predicates in  $\phi_a$  and  $\widehat{\phi}$  that are not duplicated (even with respect to aliasing).

Also, check WLP(assert  $\phi_a, \widehat{\phi}) \Rightarrow \phi_a$ , WLP(assert  $\phi_a, \widehat{\phi}) \Rightarrow \widehat{\phi}$ , and WLP(assert  $\phi_a, \widehat{\phi})$  is satisfiable.

# Advice on how to compute $\widehat{\phi}_{acc}$ :

- 1. Start with a list of the accessibility predicates in  $\phi_a$  and  $\widehat{\phi}$
- 2. Add accessibility predicates to this list for self-framing  $\phi_a$ , as some may be missing since  $\phi_a$  is not self-framed
  - (a) Duplicates (including those due to aliasing) are fine, because they will be removed later
  - (b) But, not including obvious duplicates will improve performance
- 3. Add aliasing information from the actual conjoined accessibility predicates in  $\phi_a$  and  $\widehat{\phi}$  to the non-accessibility parts of  $\phi_a$  and  $\widehat{\phi}$  respectively. In other words, the accessibility predicates

in  $\phi_a$   $(\widehat{\phi})$  separated by the separating conjunction indicate that if the fields ultimately being accessed within two or more of them are the same, then the objects being dereferenced in those field accesses do not alias, so add this information to the non-accessibility part of  $\phi_a$   $(\widehat{\phi})$  to not lose information

- (a) acc(x.f)\*acc(y.f)\*x.f = 2 implies  $acc(x.f)*acc(y.f)*x.f = 2*x \neq y$
- (b) acc(x.f)\*acc(x.f.g)\*acc(y.g)\*acc(y.g.f)\*x.f=2 implies  $acc(x.f)*acc(x.f.g)*acc(y.g)*acc(y.g.f)*x.f=2*x\neq y.g*y\neq x.f$
- 4. Determine the list of aliases and the list of non-aliases to each variable or field access dereferenced to a final field value in the current list of accessibility predicates using  $|\phi_a| * |\widehat{\phi}|$ 
  - (a) Keep in mind that if  $x.f \neq y.f$  then  $x \neq y$  and that  $x.f \neq y.f$  can be determined in many different ways, including through x.f = 3 \* y.f = 4, so the SMT solver should be helpful and necessary for this
- 5. Remove duplicate accessibility predicates, including accessibility predicates which are duplicate due to aliasing (the list of aliases and list of non-aliases for each variable and field access dereferenced to a final field value in an acc predicate should help)
  - (a) If it is unknown whether two objects alias due to missing information in  $\phi_a$  and  $\widehat{\phi}$ , then assume (for now) that they do not alias
- 6.  $\hat{\phi}_{acc}$  is the list of non-duplicated accessibility predicates conjoined with the separating conjunction

#### Important cases to consider:

```
\begin{array}{l} \mid \phi_{a} \mid * \mid \widehat{\phi} \mid = x \neq null * x.f = 1 * x.f = y.f * y.f \neq p * y.f.f > 1 \\ \mid \phi_{a} \mid * \mid \widehat{\phi} \mid = x = y * x = z * x.f = 8 * y.f > 4 \\ \mid \phi_{a} \mid * \mid \widehat{\phi} \mid = x = y * y = z * z.f + 1 \leq 10 * \text{true} \\ \mid \phi_{a} \mid * \mid \widehat{\phi} \mid = x.f.f \neq y * x \neq p * p = q * x.f > y * y > z \\ \mid \phi_{a} \mid * \mid \widehat{\phi} \mid = y > x.f * x.f > z * r \geq x.f * x.f \geq s \\ \mid \phi_{a} \mid * \mid \widehat{\phi} \mid = y > x.f * x.f > z * r \geq x.f * x.f \geq s \\ \mid \phi_{a} = acc(x.f) * y = 2 \text{ and } \widehat{\phi} = acc(z.f) * z.f = 4 \\ \mid \phi_{a} = acc(x.f) * x.f = 4 \text{ and } \widehat{\phi} = acc(z.f) * z.f = 4 \end{array}
```

# **Assumptions:**

We assume that objects are only referred to in formulas through variables or as field accesses, variables or field accesses which refer to objects are not used in binary operations ( $\oplus$ ), and variables or field accesses which refer to objects are not used in comparison operators other than  $\neq$  and =.

WLP(release 
$$\phi_a, \widehat{\phi}) =$$
WLP(hold  $\phi_a \{s\}, \widehat{\phi}) =$ 

# 3 Algorithmic WLP calculus definitions over gradual formulas

 $\widetilde{\mathrm{WLP}}(s,\widehat{\phi}) = \mathrm{WLP}(s,\widehat{\phi})$  where s is not a call statement

$$\widetilde{\text{WLP}}(skip, ? * \phi) = ? * \phi$$

$$\widetilde{\text{WLP}}(s_1; s_2, ? * \phi) = \widetilde{\text{WLP}}(s_1, \widetilde{\text{WLP}}(s_2, ? * \phi))$$

$$\widetilde{\text{WLP}}(T \ x := e, ? * \phi) = ? * \phi[e/x] * e = e$$

### Important cases to consider:

? \*  $\phi = ? * p = q * y.f = 2$  — no mention of e or x for substitution; need extra \* e = e because of this case

# $\mathbf{OR}$

$$\widetilde{\text{WLP}}(T\ x := e, ?*\phi) = \begin{cases} ?*\phi[e/x] & if\ \phi[e/x] \Rightarrow acc(e) \\ ?*acc(e)*\phi[e/x] & otherwise \end{cases}$$
 Check that 
$$\widetilde{\text{WLP}}(T\ x := e, ?*\phi) * x = e \ \widetilde{\Rightarrow}\ ?*\phi \text{ and that } \widetilde{\text{WLP}}(T\ x := e, ?*\phi) \text{ is satisfiable.}$$

$$\widetilde{\mathrm{WLP}}(x.f := y, ? * \phi) = \begin{cases} ? * \phi[y/x.f] & if \ \phi[y/x.f] \Rightarrow acc(x.f) \\ ? * acc(x.f) * \phi[y/x.f] & otherwise \end{cases}$$

Check that  $\widetilde{\mathrm{WLP}}(x.f := y, ?*\phi) * x.f = y \Longrightarrow ?*\phi$  and that  $\widetilde{\mathrm{WLP}}(x.f := y, ?*\phi)$  is satisfiable.

Important cases to consider:

$$?*\phi = ?*acc(x.f)*acc(x.f.f)*x = y$$

$$\widetilde{\text{WLP}}(x := new\ C, ?*\phi) = \begin{cases} ?*\phi \div x & if\ (\phi \div x) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \Rightarrow \phi \\ undefined & otherwise \end{cases}$$

where fields(C) =  $\overline{T_i} f_i$ ,  $\phi \div x$  means to transitively expand (in-)equalities ( $\odot$ ) and then remove conjunctive terms containing x, and  $\overline{x \neq e_i}$  are conjunctive terms in  $\phi$ .

Check that  $\overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and that } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? * \phi) * x \neq null * \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? \Leftrightarrow \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? \Leftrightarrow \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? \Leftrightarrow \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? \Leftrightarrow \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? \Leftrightarrow \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? * \phi \text{ and } \overline{\text{WLP}}(x := new \ C, ? \Leftrightarrow \overline{x \neq e_i} * \overline{acc(x.f_i)} \cong ? \phi \text{ acc(x.f_i)} \cong ? \phi \text{$ new  $C, ? * \phi$ ) is satisfiable.

### Important cases to consider:

Similar to the ones for the non-gradual version; replacing  $\widehat{\phi}$  with  $\phi$ .

$$\widetilde{\text{WLP}}(assert \ \phi_a,?*\phi) = ?*\text{WLP}(assert \ \phi_a,\phi)$$
 Check that 
$$\widetilde{\text{WLP}}(assert \ \phi_a,?*\phi) \overset{\sim}{\Rightarrow} ?*\phi, \ \widetilde{\text{WLP}}(assert \ \phi_a,?*\phi) \overset{\sim}{\Rightarrow} \phi_a, \text{ and that } \widetilde{\text{WLP}}(assert \ \phi_a,?*\phi) \text{ is satisfiable.}$$

#### Note:

Since  $\phi$  is not self-framed, then the resulting WLP(assert  $\phi_a, \phi$ ) will not necessarily be selfframed. This is okay due to? accounting for the lack of self-framing and since WLP(assert  $\phi_a, \phi$ ) does not lose any information from  $\phi_a$  or  $\phi$  (in fact, it gains information with respect to  $\phi_a$ ). So, allow this call to WLP(assert  $\phi_a, \widehat{\phi}$ ) even though  $\phi$  is not self-framed.

#### Important cases to consider:

Similar to the ones for the non-gradual version; replacing  $\widehat{\phi}$  with  $\phi$ .

**Note:** The static parts of gradual formulas do not need to be self-framed unless the gradual formula is completely precise (completely static). The imprecision can account for the framing.

4~ Gradual formula implication and satisfiability  $_{\rm TBD}$
